

Clean Versions of Replacement Claims

Please amend claim 10 to conform to the following clean version.

10. A method of performance monitoring in a distributed system, comprising the steps of:

determining a set of significant events that are to be monitored in a distributed application in the distributed system;

providing each of a set of nodes applications associated with the significant events with a recorder function which when called generates a record that

identifies the corresponding significant event and includes a time-stamp for the corresponding significant event obtained from a corresponding synchronized clock;

running an experiment in the distributed application

that generates one or more of the significant events;

obtaining the records from the node applications and analyzing the records.
